# ISOTROPIC UPDATE & REVIEW

Rich Ormiston, Andrew Matas

July 3, 2018

# LATEST RUN: 18/05/29

# DATA / DQ

- Analyzed full O2 run
- 1s time shift
- 192s segments, 1/32 Hz bins
- Removed CAT1 veto from CBC veto definer file
- Notch list
- JOB-FILE-1164556817-1187733618_CLEAN_C02_v2.dat

# RESULTS

*Results include 1.06 bias factor

| Spectral Index $\alpha$ | Y/10e-8 | $\sigma$ /10e-8 | SNR |
|---|---|---|---|
| 0 | 1.40 | 1.00 | 1.40 |
| 2/3 | 1.03 | 0.76 | 1.36 |
| 3 | -0.03 | 0.13 | -0.23 |

# SENSITIVITY OF O1 + O2

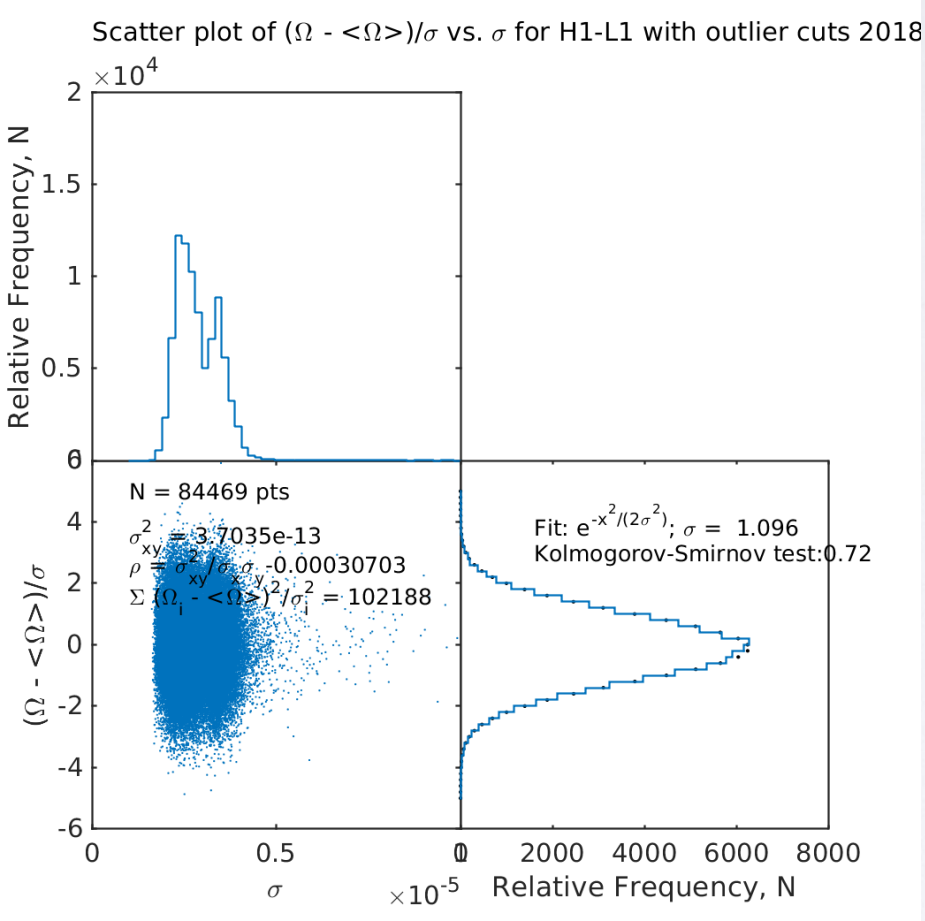
- Hubble scaling: $\sigma_{O2} \rightarrow \sigma_{O2}/h_0^2 = 2.16 \times 10^{-8}$
- Since $\sigma_{O1} = 5.9 \times 10^{-8}$ then,

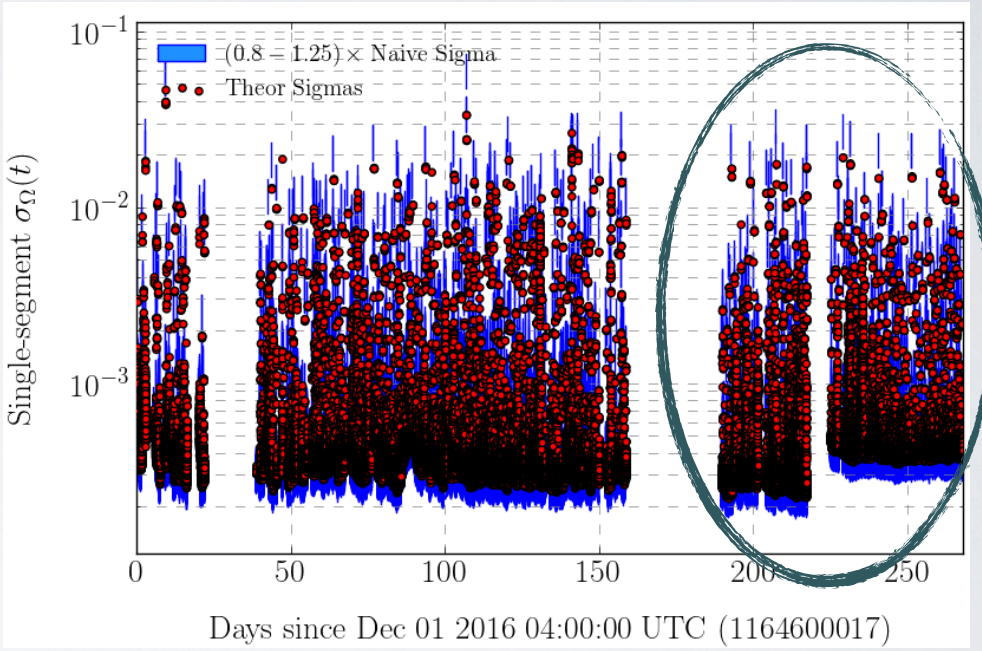
  $$\sigma_{O1+O2} = \left(\sigma_{O1}^{-2} + \sigma_{O2}^{-2}\right)^{-1/2} = 2.03 \times 10^{-8}$$

- Improvement $= \sigma_{O1}/\sigma_{O1+O2} = 2.91$
- Compare to C00 data which saw an improvement of ~2.40 [aLOG 339644]

# FOLLOWING UP ON ODDITIES

# BIMODAL SIGMA DISTRIBUTION

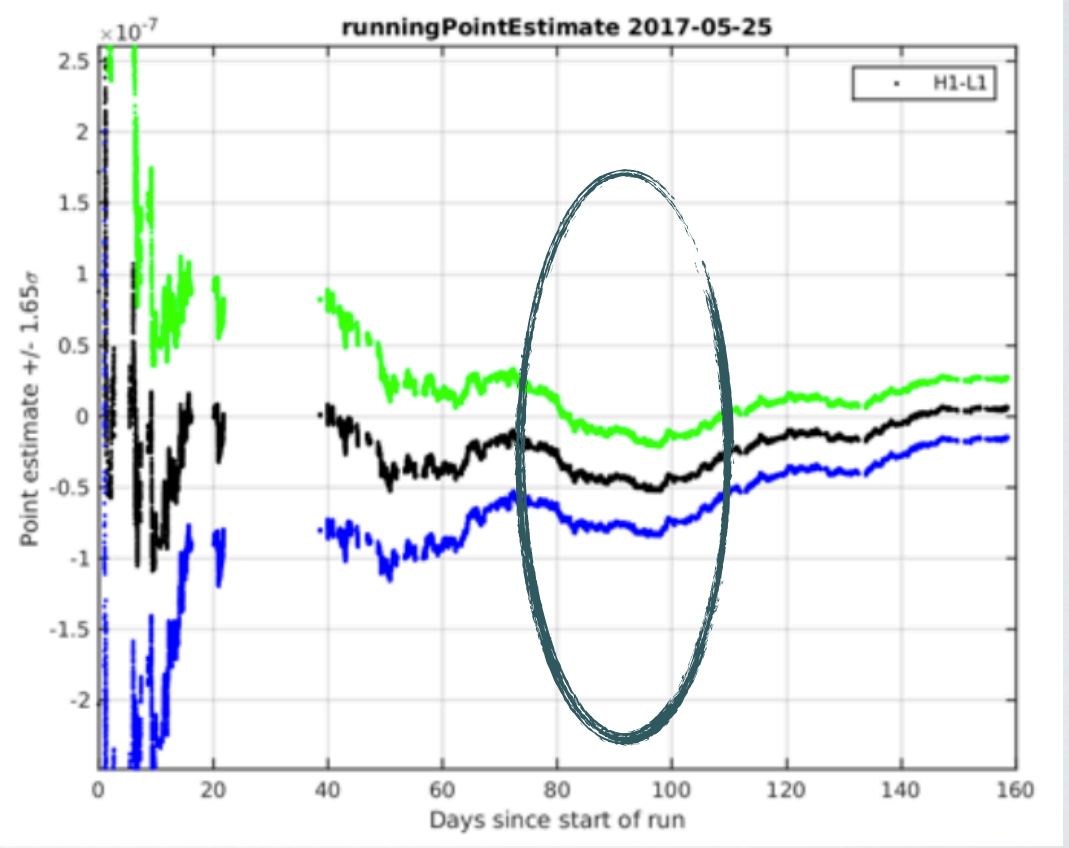




Systematic jump in sigma around July caused by earthquakes

# DIP IN POINT ESTIMATE

- Ran post-processing on days 70-90. Found SNR of -2.7
- Removing lines with |SNR| > 2 results in an SNR of about -2
- Dip could just be a statistical fluctuation



# COMPUTE_STATS2
# CODE REVIEW

# ROUGH BREAKDOWN

- Initialize narrow-band point estimate and sigma matrices (sigma and Y for each detector pair)
- Compute the narrowband statistics, handle notched bins, and add the statistics of each detector pair to the point estimate and sigma matrices
- Combine the narrowband results over detectors
- Apply notching, Hubble factor and bias
- Compute broadband statistics

# EQUATIONS USED

Narrowband sigma and Y for each detector pair

$$\sigma_{\hat{Y}_\alpha, I}(f) = \frac{1}{\sqrt{S_{\alpha, I}(f)\Delta f}}$$

$$\sigma_{tot, \hat{Y}_\alpha, I} = \left( \sum_f \sigma^{-2}_{\hat{Y}_\alpha, I}(f) \right)^{-1/2}$$

$$\hat{Y}_{\alpha, I}(f) = \frac{2}{\sigma^2_{tot, \hat{Y}_\alpha, I}} Re \left[ \frac{p_I(f)}{S_{\alpha, I}(f)} \right]$$

Sum over detectors

Final broadband statistics

$$\hat{Y}_\alpha = \frac{\sum_f \hat{Y}_\alpha(f) \sigma^{-2}_{\hat{Y}_\alpha}(f)}{\sum_{f'} \sigma^{-2}_{\hat{Y}_\alpha}(f')}$$

$$\sigma_{\hat{Y}_\alpha} = \left( \sum_f \sigma^{-2}_{\hat{Y}_\alpha}(f) \right)^{-1/2}$$

Sum over frequencies

$$\hat{Y}_\alpha(f) = \frac{\sum_I \hat{Y}_{\alpha, I}(f) \sigma^{-2}_{\hat{Y}_\alpha, I}(f)}{\sum_I \sigma^{-2}_{\hat{Y}_\alpha, I}(f)}$$

$$\sigma_{tot}(f) = \left( \sum_I \sigma^{-2}_{\hat{Y}_\alpha, I}(f) \right)^{-1/2}$$

# THANKS!
